

Most important

IMPORTANT !

Before bringing your new Rottweiler puppy home, it is essential to disinfect your environment with F10 SC Veterinary Disinfectant, a world-renowned, veterinary-grade product that is highly effective against viruses (including Parvovirus), bacteria, fungi, and spores. Puppies are especially vulnerable before their vaccination series is completed, and F10 provides a proven layer of protection against many life-threatening pathogens.

 *How to use F10 SC correctly:*

Dilute 8 ml of F10 SC in 1 litre of clean water.

Use this solution to thoroughly spray and disinfect all indoor and outdoor surfaces,

including floors, carpets, kennels, patios, and outbuildings.

Allow treated areas to dry naturally for at least 30 minutes before introducing your puppy.

Continue routine disinfection after your puppy arrives, paying special attention to high-risk contamination points.

 *Ongoing biosecurity precautions until your puppy is fully vaccinated (16+ weeks):*

Spray car tyres, shoes, and any items that may have been exposed to public areas (parks, shops, training grounds) with F10 before re-entering your home.

Regularly reapply F10 solution to frequently used areas, especially where other animals may have passed.

Maintain this strict disinfection protocol until your puppy's full vaccination course is complete, as maternal antibodies may interfere with early vaccines, leaving puppies vulnerable.

☒ *Why this matters: Parvovirus and other pathogens are extremely resilient in the environment and can survive for months on surfaces, soil, and even on shoes or clothing. Using F10 SC consistently reduces the risk of exposure and is one of the most important steps in keeping your puppy safe during their early weeks at home.*
